## Louisiana Arbovirus Surveillance Summary 2012

CDC Week 49 From: 01/01/2012-12/08/2012

Contact- Christine Scott-Waldron, MSPH phone: 504-568-8301 or email: cwaldron@la.gov

#### **Table of Contents** Topic: Page Number: Report Summary 1 WNV Human Clinical Picture: Aggregate Report by Disease Type, Age Group and Gender 2 WNV-NID, Fever and Asymptomatic Infections in Louisiana by Parish According to CDC Week (with EpiCurve) 3 WNV-NID by Parish from 2002-Present (parishes highlighted in grey have cases each year) 6 WNV-NID Cases by CDC Week for Each Year from 2002-Present 7 Proportion of Human Clinical Presentations by Year from 2002-Present 7 Arboviral Horse Infections in Louisiana by Parish According to CDC Week (with EpiCurve) 8 CDC Weeks (Week Starting-Week Ending) 10

### **Report Summary**

The goal of the surveillance for West Nile Infections in Humans is to describe the disease burden of the West Nile infection on the human population. Only West Nile Neuro-invasive diseases (encephalitis or meningitis) get reliably reported. For every NID case there are about 10 cases of Fever and about 90 completely asymptomatic infections. Only 1% of the WN-Fever and asymtomatic cases are reported. Although we show the number of cases of all WN infections, it is important to remember that only WN-NID cases are useful for monitoring disease burden and trends in WN in humans.

**Humans:** As of this report, 391 human WNV infections have been identified. There are 46 asymptomatic cases, 34 identified through screening of blood donors. Of the 345 WNV cases with symptoms, 158 are classified as WNV neuroinvasive disease (NID) cases, the most severe presentation of the disease, and 187 are classified as WNV fever cases, the WNV-related mild, febrile illness. There have been 0 cases of California group Encephalitis (LaCrosse Encephalitis), 0 cases of Eastern Equine Encephalitis and 0 cases of St. Louis Encephalitis reported. Sporadic cases of these arboviruses often occur from year to year in the state.

Horses: There have been 67 confirmed cases of equine WNV and 55 confirmed cases of EEE in Louisiana this year.

**Sentinel Chickens:** Have been used in the past as a statewide early warning system to detect arbovirus transmission. These chickens in secure cages were strategically placed and bled regularly. Serologic tests performed on the sentinel chickens provided information of current and local transmission of many arboviruses. However, experience shows that this was not very effective in providing information about local transmission.

**Dead Birds:** Are no longer collected statewide because testing of dead birds does not provide information on where and when the bird was infected or of local transmission. Dead birds can only indicate that the bird died at a particular location of an arbovirus endemic to Louisiana.

**Mosquito Pools:** This is the most effective surveillance system to monitor arboviral transmission. Arboviruses are detected through nucleic acid testing of pools of 50 or more mosquitoes of the same species. A positive mosquito pool is an indicator of recent transmission, between mosquitoes and birds, horses or humans. There have been over 26,371 mosquito pools from over 29 parishes submitted for testing. 4 EEE positive pools, 0 SLE positive pools and 2,501 WNV positive pools have been found in 29 parishes.

#### **Explanation of Clinical Disease:**

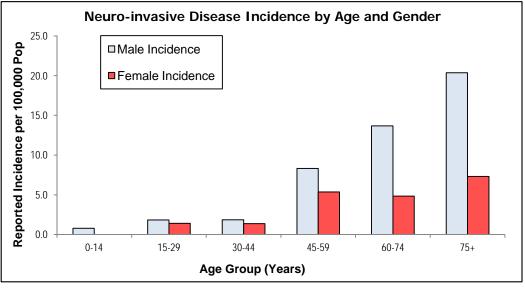

WN infections have occurred each year in Lousiana for the last 10 years. Persons of all ages are considered equally susceptible to infection. The majority of all persons infected and immunocompetent are completely asymptomatic (80-90%). A smaller proportion of persons (10-20%) present with influenza-like illness with abrupt onset of fever. A minority of people develop a serious neurologic illness such as aseptic meningitis or encephalitis (0.2 younger than 65 years old, 2% older than age 65). About 10% of people who develop neuroinvasive disease can die. The reporting of deaths caused by WN NID is not mandated by the Louisiana Sanitary code. It has been inconsistent in the past. It is limited to those occuring within 2 weeks for onset.

Limitations: Human data have very limited usefulness for mosquito control purposes. Only 2% of all WN infections are reported (because most WN infections are asymptomatic or WN fever cases do not get medical care, they never get diagnosed nor are reported). The reporting of those cases is delayed. From the time a mosquito bites a bird infected with WN viruses, it takes 1 to 2 weeks depending on temperatures and other environmental conditions for the virus to multiply in the mosquito vector (extrinsic incubation period); then it takes 3 to 14 days for the virus to multiply in the human host (intrinsic incubation period); it then takes several days from onset of disease to seeking medical care; then a few more days for a physician to order a confirmatory lab test and get the result back (one week from onset, if all goes well); then any where from a few days to a week or two to get the report to DHH OPH. All in all, from the initial mosquito infection to the reporting of the infection it may take from 3 to 6 weeks. In summary, human data are too little too late to be of major use for mosquito control. To provide mosquito control program with data on location of human cases that may be of limited use for correlating infection rates in mosquitoes and human cases and of use to address public and media concern, general geographical location of cases and weeks of onset are provided to mosquito control who request the information. This information must remain strictly confidential. The DHH OPH Laboratory is a reference laboratory used for epidemiologic purposes. Its role in diagnosis of cases is limited since the great majority of physicians and hospitals use private laboratories for their diagnosis.
